PHOTOCHEMISTRY OF SMALL MOLECULES

HIDEO OKABE
National Bureau of Standards

A WILEY-INTERSCIENCE PUBLICATION • JOHN WILEY & SONS
NEW YORK • CHICHESTER • BRISBANE • TORONTO

Preface

This book has been written in an attempt to cover the remarkable progress made in recent years in the field of photochemistry of small molecules with up to five atoms in the gas phase.

The advancement of flash photolysis-kinetic spectroscopy, laser technology, and other new techniques has made possible the detection of photochemical primary products and detailed studies of photodissociation dynamics. The secondary processes of atoms and radicals formed in the primary process have also been studied extensively. The reactivities of electronically excited atoms (C, O, S, etc.) and radicals (C_2O , CH_2 , etc.) have been found to be very different from those of corresponding ground state atoms and radicals. The results of these studies, together with the traditional end product analysis and quantum yield measurements, have greatly aided in our understanding of the photochemical processes, particularly for small molecules. These recent developments, as well as the underlying principles, are described in some detail in dealing with the photochemistry of about 80 small molecules.

Studies of the photochemical processes of small molecules are not only of intrinsic interest but also are important in understanding the photochemistry of isotope enrichment, of air pollution in the troposphere and stratosphere, and of the atmospheres of other planets.

This book is aimed at the physical chemist, spectroscopist, and atmospheric scientist interested in photochemistry. As a reference book it lists about 1200 papers, including some original classic studies and those of recent years up to July 1977. The space limitation and the tremendous amount of publication in the last decade have prevented inclusion of some important papers. I apologize to those whose work has not been quoted.

Since the photochemical reaction is initiated by absorption of light in the visible, ultraviolet, and vacuum ultraviolet regions, an understanding of atomic and molecular spectroscopy is required. *Chapter I* gives a brief introduction to the electronic states and transitions in atoms and simple molecules.

The primary photochemical process brought about by light absorption is dealt with in *Chapter II*. A great deal of information on photodissociation dynamics (such as the lifetimes of the excited states of reactant molecules and the electronic, translational, and internal energy distribution in photo-fragments) has recently been obtained, particularly for some diatomic and

triatomic molecules. Quantum mechanical theory dealing with dynamics of photodissociation has been proposed by many workers.

Various experimental techniques of photochemistry are described briefly in *Chapter III*.

Further details are given by Calvert and Pitts (4), Noyes and Leighton (22), and McNesby et al. (685a).

Production, detection, and reactivities of various electronically excited atoms are given in *Chapter IV*. The importance of electronically excited atom reactions in photochemistry has been recognized only recently.

Photochemical processes and electronic states of simple molecules with up to five atoms and radicals with up to four atoms in the gas phase are covered in *Chapters V through VII*. The absorption coefficients available for many molecules are shown in figures, as they are important in understanding the quantitative aspect of photochemistry. Bond dissociation energies given are calculated mostly from enthalpies of formation of atoms, radicals, and molecules tabulated in the *Appendix*.

Finally, enrichment of isotopic species has been achieved for a number of atoms and molecules using an appropriate monochromatic light source that preferentially excites an isotopic species of interest in mixtures of other isotopic species. The photochemistry associated with isotopic enrichment is briefly described in *Chapter VIII*. Great efforts have been made recently to obtain information on the detailed photochemical processes involving smog formation, stratospheric pollution, and atmospheres of other planets, and brief discussions of these subjects are also presented in the chapter.

I would like to express my appreciation to Professor W. A. Noyes, Jr., who introduced me to the field of photochemistry and to the late Dr. E. W. R. Steacie, the late Professor W. Groth, and Professor J. R. McNesby, who taught me various aspects of photochemistry. I am particularly grateful to Dr. R. E. Rebert who has carefully read Chapters I, II, and VII and to Dr. A. H. Laufer for his critical reading of Chapters III through VI and VIII. Their numerous suggestions have greatly improved the manuscript. Thanks are due to Dr. M. D. Scheer for his continuous encouragement and to many friends and colleagues, especially to Drs. D. Garvin, P. J. Ausloos, R. F. Hampson, M. Krauss, and V. H. Dibeler and Professor J. P. Simons for their help and discussion during the preparation of the manuscript. I would like to thank Professor S. A. Rice at the University of Chicago who has given me the opportunity to write this book. I am indebted to Mrs. P. A. Davis who did an excellent job in typing the entire manuscript.

INTRODUCTION

CHAPTER I: SPECTROSCOPY OF ATOMS AND MOLECULES

I-1	Electronic States of Atoms, 5	1
I-1.1	Atoms with One Outer Electron, 5	
I-1.2	Atoms with More Than One Outer Electron, 7	
I-2	Quantum States of Diatomic Molecules, 8	5
I-2.1	Rotational Energy Levels of Diatomic Molecules, 8	
I-2.2	Vibrational Energy Levels of Diatomic Molecules, 10	
I-2.3	Electronic States of Diatomic Molecules, 11	
I-2.4	Coupling of Rotation and Electronic Motion in Diatomic Molecules; Hund's Coupling Cases, 12	
I-3	Quantum States of Polyatomic Molecules, 14	
I-3.1	Rotational Levels of Polyatomic Molecules, 14	
I-3.2	Vibrational Levels of Polyatomic Molecules, 15	
I-3.3	Electronic States of Polyatomic Molecules, 16	
I-4	Thermal Contribution to Photodissociation, 18	
I-4.1	Vibrational Population in Diatomic Molecules, 18	
I-4.2	Rotational Population in Diatomic Molecules, 19	
I-4.3	Thermal Contribution to Photolysis and Fluorescence, 20	
I-5	Electronic Transition in Atoms, 22	
I-5.1	Einstein Transition Probabilities, 23	
I-5.2	Absorption Intensity of Atoms, 24	
I-5.3	Oscillator Strength, 25	
I-6	Resonance Absorption and Emission by Atoms, 27	
I-6.1	Line Profile in Resonance Absorption; Natural, Doppler and Pressure Broadening, 27	
I-6.2	Line Profile in Resonance Emission; Four Types of Resonance Lamps, 31	
I-6.3	Measurement of the Absorption Intensity Using a Resonance Lamp, 35	
I-7	Band Intensities in the Molecular System, 37	
I-8	Absorption Coefficient in the Molecular System, 41	
I-8.1	The Beer-Lambert Law in the Molecular System, 41	
I-8.2	Deviation from the Beer-Lambert Law, 42	
I-8.3	Measurement of the Integrated Absorption Coefficient, 44	
I-8.4	Temperature Dependence of the Continuous Absorption Spectrum, 44	

- I-9 Electronic Transitions in Diatomic Molecules, 46
 I-9.1 Vibrational Structure in the Electronic Transition, 47
 I-9.2 The Franck-Condon Principle, 47
 I-9.3 Rotational Structure in the Electronic Transition, 49
 I-10 Selection Rules in Atoms and Molecules, 50
 I-10.1 Selection Rules in Atoms, 50
 I-10.2 Electronic Transitions in Diatomic Molecules, 51
 I-10.3 Electronic Transitions in Polyatomic Molecules, 53

CHAPTER II: PRIMARY PHOTOCHEMICAL PROCESSES IN SIMPLE MOLECULES

57

- II-1 The Primary Processes in Diatomic Molecules, 58
 II-1.1 Spectroscopic Studies of Diatomic Molecules, 58
 II-1.2 Photochemical Studies of Diatomic Molecules, 61
 II-2 The Primary Processes in Simple Polyatomic Molecules, 64
 II-2.1 Fluorescence in Simple Polyatomic Molecules, 64
 II-2.2 Photodissociation in Simple Polyatomic Molecules, 66
 II-2.3 Predissociation in Simple Polyatomic Molecules, 68
 II-3 Correlation Rules in Photodissociation, 71
 II-3.1 Examples of Spin Correlation Rules, 71
 II-3.2 Examples of Symmetry Correlation Rules, 73
 II-4 Distribution of the Excess Energy in Photofragments, 81
 II-4.1 Measurement of the Translational Energy of Photofragments, 82
 II-4.2 Measurement of the Internal Energy of Photofragments, 86
 II-5 Angular Distribution of Photofragments, 88
 II-6 Models for Energy Partitioning in Photodissociation, 92
 II-6.1 Statistical Model, 92
 II-6.2 Impulsive Model, 93
 II-6.3 Equilibrium Geometry Model, 94
 II-6.4 Other Models, 95
 II-6.5 Rotational Excitation, 96
 II-7 Determination of Bond Dissociation Energies, 97
 II-7.1 Determination of Bond Dissociation Energies from Thermochemical Data, 98
 II-7.2 Determination of the Bond Dissociation Energies in Diatomic Molecules, 100
 II-7.3 Determination of the Bond Dissociation Energies in Simple Polyatomic Molecules, 101

CHAPTER III: EXPERIMENTAL TECHNIQUES IN PHOTOCHEMISTRY

107

- III-1 Light Sources, 107
 III-1.1 Atomic Line Sources in the Vacuum Ultraviolet Region, 108

- III-1.2 Atomic Line Sources in the Ultraviolet and Visible Regions, 111
 III-1.3 Molecular Band Sources, 113
 III-1.4 Lasers, 116
 III-2 Materials for Photochemical Studies, 119
 III-2.1 Window Materials, 119
 III-2.2 Filters, 121
 III-3 Quantum Yields, 121
 III-3.1 Definition, 121
 III-3.2 Calculation of the Primary Quantum Yield, 123
 III-4 Actinometry, 125
 III-4.1 Chemical Actinometers in the Vacuum Ultraviolet Region, 126
 III-4.2 Chemical Actinometers in the Ultraviolet Region, 127
 III-5 Determination of the Elementary Reaction Rates, 128
 III-5.1 Pseudo-First-Order Decay of Reactive Species, 130
 III-5.2 Second-Order Decay of Reactive Species, 131
 III-5.3 Time Dependent Radical Concentration by Consecutive Reactions, 133
 III-6 Determination of the Primary Photochemical Process by Radical Trapping Agents, 135
 III-6.1 Examples, 136

CHAPTER IV: PRODUCTION AND QUENCHING OF ELECTRONICALLY EXCITED ATOMS

139

- IV-1 Fluorescence Quenching in Atoms; Quenching Cross Sections, 139
 IV-2 Mercury Sensitized Reactions, 144
 IV-2.1 $\text{Hg}(^3P_1) + \text{H}_2$, 145
 IV-2.2 $\text{Hg}(^3P_1) + \text{N}_2$, $\text{Hg}(^3P_1) + \text{CO}$, 145
 IV-2.3 $\text{Hg}(^3P_1) + \text{H}_2\text{O}$, $\text{Hg}(^3P_1) + \text{NH}_3$, 146
 IV-2.4 $\text{Hg}(^3P_1) + \text{Paraffins}$, 146
 IV-2.5 $\text{Hg}(^3P_1) + \text{Olefins}$, 146
 IV-2.6 $\text{Hg}(^3P_1)$ Sensitized Reactions, 146
 IV-3 Other Atom Sensitized Reactions, 147
 IV-3.1 $\text{Cd}(^3P_1, ^1P_1)$ Sensitized Reactions, 147
 IV-3.2 $\text{H}(^2P)$ Sensitized Reactions, 147
 IV-3.3 $\text{Na}(^2P)$ Sensitized Reactions, 147
 IV-3.4 $\text{Ar}(^3P_1, ^1P_1)$ Sensitized Reactions, 148
 IV-3.5 $\text{Kr}(^3P_1, ^1P_1)$ Sensitized Reactions, 148
 IV-3.6 $\text{Xe}(^3P_1)$ Sensitized Reactions, 148
 IV-4 Reactions of Metastable O Atoms, 149
 IV-4.1 $\text{O}(^1D)$ Atoms, 149
 IV-4.2 $\text{O}(^1S)$ Atoms, 152
 IV-5 Reactions of Metastable S Atoms, 156
 IV-5.1 $\text{S}(^1D)$ Atoms, 156
 IV-5.2 $\text{S}(^1S)$ Atoms, 157

- IV-6 Reactions of Metastable and Ground State C Atoms, 157
 IV-6.1 $C(^1D)$ Atoms, 157
 IV-6.2 $C(^1S)$ Atoms, 157
 IV-6.3 $C(^3P)$ Atoms, 159
- IV-7 Reactions of Other Metastable Atoms, 159
 IV-7.1 $N(^1D, ^3P)$ Atoms, 159
 IV-7.2 $Br(^2P_{1/2})$ Atoms, 160
 IV-7.3 $I(^2P_{3/2})$ Atoms, 160
 IV-7.4 $As(^2D, ^2P)$ Atoms, 160
 IV-7.5 $Sn(^1D, ^1S)$ Atoms, 161
 IV-7.6 $Pb(^1D, ^1S)$ Atoms, 161

CHAPTER V: PHOTOCHEMISTRY OF DIATOMIC MOLECULES

- V-1 Hydrogen, 162
- V-2 Hydrogen Halides, 162
 V-2.1 Hydrogen Fluoride, 162
 V-2.2 Hydrogen Chloride, 162
 V-2.3 Hydrogen Bromide, 164
 V-2.4 Hydrogen Iodide, 164
- V-3 Carbon Monoxide, 166
 V-3.1 Photochemistry, 167
- V-4 Nitrogen, 168
 V-4.1 Photodissociation in the Upper Atmosphere, 170
- V-5 Nitric Oxide, 171
 V-5.1 Fluorescence, 173
 V-5.2 Predissociation, 173
 V-5.3 Photodissociation, 174
 V-5.4 NO in the Upper Atmosphere, 176
- V-6 Oxygen, 177
 V-6.1 $O_2(^1\Sigma_g^-)$, 177
 V-6.2 $O_2(^1\Delta_g)$, 181
 V-6.3 $O_2(^1\Sigma_g^+)$, 183
- V-7 Sulfur, 184
- V-8 Halogens, 184
 V-8.1 Fluorine, 184
 V-8.2 Chlorine, 184
 V-8.3 Bromine, 185
 V-8.4 Iodine, 187
- V-9 Interhalogens, 191
 V-9.1 Bromine Monochloride, 191
 V-9.2 Iodine Monochloride, 191
 V-9.3 Iodine Monobromide, 191
- V-10 Alkali Iodides, 192
 V-10.1 Sodium Iodide, 192
 V-10.2 Potassium Iodide, 192

CHAPTER VI: PHOTOCHEMISTRY OF TRIATOMIC MOLECULES

- VI-1 Water (H_2O), 201
 VI-1.1 Photodissociation, 201
- VI-2 Hydrogen Sulfide (H_2S), 204
 VI-2.1 Photodissociation, 204
 VI-2.2 Energy Partitioning in Photodissociation of H_2S , 205
- VI-3 Hydrogen Cyanide (HCN), 206
 VI-3.1 Photochemistry, 206
- VI-4 Cyanogen Halides, 206
 VI-4.1 Photochemistry, 206
- VI-5 Carbon Dioxide (CO_2), 208
 VI-5.1 Photochemical Reactions, 209
 VI-5.2 Stability of CO_2 in the Mars and Venus Atmosphere, 214
- VI-6 Carbonyl Sulfide (OCS), 215
 VI-6.1 Photodissociation in the Near Ultraviolet (1900 to 2550 Å), 215
 VI-6.2 Photodissociation in the Vacuum Ultraviolet, 217
- VI-7 Carbon Disulfide (CS_2), 217
 VI-7.1 Photochemistry above 2778 Å, 218
 VI-7.2 Photochemistry below 2778 Å, 219
- VI-8 Nitrous Oxide (N_2O), 219
 VI-8.1 Photochemical Reactions, 223
 VI-8.2 Production of Metastable Species by the Photolysis of N_2O , 225
 VI-8.3 N_2O in the Upper Atmosphere, 226
- VI-9 Nitrogen Dioxide (NO_2), 227
 VI-9.1 Photodissociation above 3980 Å, 230
 VI-9.2 Photodissociation below 3980 Å, 230
 VI-9.3 Photodissociation in the Vacuum Ultraviolet, 232
 VI-9.4 Fluorescence, 232
 VI-9.5 Nitrogen Dioxide in the Atmosphere, 235
- VI-10 Nitrosyl Halides, 235
 VI-10.1 Nitrosyl Chloride (ONCl), 235
 VI-10.2 Nitrosyl Fluoride (NOF), 237

- VI-11 Ozone (O_3), 237
 VI-11.1 Photodissociation in the Chappuis Bands (4400 to 8500 Å), 240
 VI-11.2 Photodissociation in the Huggins Bands (3000 to 3600 Å), 240
 VI-11.3 Photodissociation in the Hartley Bands (2000 to 3200 Å), 241
 VI-11.4 Photolysis of O_3 in the Presence of Other Gases, 244
 VI-11.5 Ozone in the Atmosphere, 245
 VI-12 Sulfur Dioxide (SO_2), 247
 VI-12.1 Spectroscopy and Photochemistry of SO_2 in the 3400 to 3900 Å Region, 248
 VI-12.2 Spectroscopy and Photochemistry in the 2600 to 3400 Å Region, 251
 VI-12.3 Spectroscopy and Photochemistry in the 1800 to 2350 Å Region, 254
 VI-12.4 Photochemistry in the 1100 to 1800 Å Region, 254
 VI-12.5 Photooxidation of SO_2 in the Atmosphere, 255
 VI-13 Chlorine Oxides, 257
 VI-13.1 Chlorine Dioxide (ClO_2), 257
 VI-13.2 Chlorine Monoxide (Cl_2O), 257
 VI-14 Triatomic Radicals; Photochemical Production, Detection, and Reactivities, 258
 VI-14.1 Methylene (CH_2), 258
 VI-14.2 Amidogen (NH_2), 261
 VI-14.3 Phosphorus Hydride (PH_2), 262
 VI-14.4 Ethynyl (C_2H), 262
 VI-14.5 Formyl (HCO), 263
 VI-14.6 Nitroxyl Hydride (HNO), 263
 VI-14.7 Hydroperoxyl (HO_2) and HSO Radical, 263
 VI-14.8 Triatomic Carbon (C_3), CCO Radical, 265
 VI-14.9 Azide (N_3), NCN Radical, NCO Radical, 266
 VI-14.10 Carbon Difluoride (CF_2), 268
 VI-14.11 Disulfur Monoxide (S_2O), 268
 VI-15 Chlorine Oxide (ClO), 268
 VI-16 Nitrogen Oxides, 268
 VI-16.1 Nitric Oxide (NO), 268
 VI-16.2 Nitrogen Dioxide (NO_2), 268
 VI-16.3 Nitrogen Trioxide (NO_3), 296
 VI-16.4 Sulfur Trioxide (SO_3), 297
 FIVE-ATOM MOLECULES
 VII-17 Methane (CH_4), 298
 VII-18 Halogenated Methanes, 299
 VII-18.1 Methyl Chloride (CH_3Cl), Methyl Bromide (CH_3Br), 300
 VII-18.2 Methyl Iodide (CH_3I), 301
 Trifluoromethane (CF_3I), 301
 VII-18.3 Methylene Iodide (CH_2I_2), Iodoform (CHI_3), Chloroform ($CHCl_3$), 303
 VII-18.4 Trichlorofluoromethane ($CFCl_3$, Freon-11), Dichlorodifluoromethane (CF_2Cl_2 , Freon-12), Dibromodifluoromethane (CF_2Br_2), 304

PHOTOCHEMISTRY OF SMALL MOLECULES

Fig. V-12. Absorption coefficients of O_2 in the region 1100 to 2000 Å. k is in units of $\text{atm}^{-1} \text{cm}^{-1}$, base c , 1300 to 1700 Å, Schumann-Runge continuum, 1750 to 1950 Å, Schumann-Runge bands. From Watanabe et al. (1014), reprinted by permission. Copyright 1953 by the American Institute of Physics.

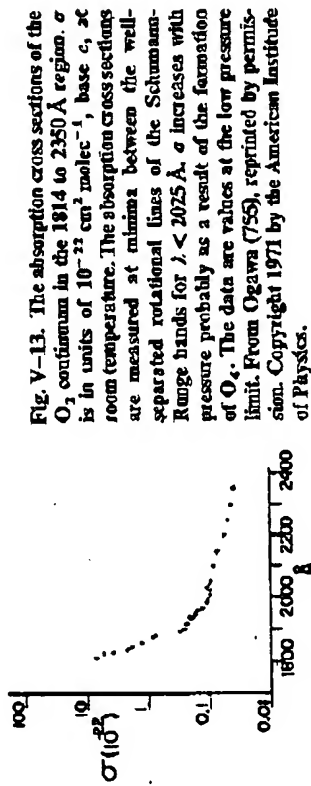

Fig. V-13. The absorption cross sections of the O_2 continuum in the 1814 to 2350 Å region. σ is in units of $10^{-22} \text{cm}^2 \text{molec}^{-1}$, base c , at room temperature. The absorption cross sections are measured at minima between the well-separated rotational lines of the Schumann-Runge bands for $\lambda < 2025 \text{Å}$. σ increases with pressure probably as a result of the formation of O_4 . The data are values at the low pressure limit. From Ogawa (755), reprinted by permission. Copyright 1971 by the American Institute of Physics.

Fig. V-14. Potential energy curves of O_2 . S-R, Schumann-Runge bands; H, Herzberg bands; A-A, atmospheric bands. The line-broadening was observed at $v' = 4$ of the $B^3\Sigma_u^-$ state at which point the repulsive ${}^3\Pi_u$ state crosses the $B^3\Sigma_u^-$ state. See Murrell and Taylor (726). From "Dissociation Energies and the Spectra of Diatomic Molecules" by Gaydon, 3rd Ed. 1968, p. 74, reprinted by permission of Associated Book Publishers Ltd.

determined (104, 341, 444). They are given in Table V-8. Ackerman et al. (38) have measured the absorption coefficients for individual rotational lines in the region 1750 to 2050 Å. The oscillator strengths of the Herzberg I bands from (4, 0) to (11, 0) have been measured by Hasson and Nicholls (446). An absorption coefficient of $0.30 \pm 0.03 \text{ atm}^{-1} \text{cm}^{-1}$ at the 1216 Å line has been determined by several workers (381, 753).

Photochemistry. The threshold wavelengths for the production of $O(^3P)$, $O(^1D)$, and $O(^1S)$ are given below.

	Threshold Wavelength (Å)
$O_2 \xrightarrow{h\nu} O(^3P) + O(^3P)$	2424
$O_2 \xrightarrow{h\nu} O(^3P) + O(^1D)$	1750
$O_2 \xrightarrow{h\nu} O(^3P) + O(^1S)$	1332

Ackerman and Bjaune (37) have observed that rotational lines become diffuse at $v' = 4, 8$, and 11 for the Schumann-Runge system. They attribute the diffuseness to predissociation.

A line width of 3 cm^{-1} observed by them implies a lifetime on the order of 10^{-11} sec for the (4, 0) level. It is suggested by Carroll (192) and Murrell and Taylor (726) that predissociation is due to the crossing of the repulsive
